CreatorConnect AI

AI-powered marketplace connecting content creators with brands.

A lightweight marketplace that helps creators present their work and helps brands discover, evaluate, and collaborate with them.

What you can do

Discover creators

Browse creator profiles and filter by niche, platform, skills, or budget. Profiles include bios, sample work, audience details, and portfolio links.

Build a portfolio

Creators can build and publish a profile with their skills, platforms, experience, rates, and past work. AI can draft a headline and introduction.

Plan with the AI Chatboard

Ask for campaign direction, creator portfolio feedback, or content ideas. Replies are designed to be practical and easy to act on.

Generate campaign content

Create draft captions, social content ideas, a campaign brief, and hashtags from a product, audience, platform, and tone.

Match creators to campaigns

Brands can rank creators using transparent criteria: niche (35%), platform (20%), skills (20%), budget (15%), and audience (10%).

Manage collaborations

Brands can create campaigns, review applications, save creators, and update application statuses. Creators can apply and track responses.

How AI and demo mode work

AI requests are sent by the Flask backend; the API key is not exposed to the browser. Configure `ANTHROPIC_API_KEY` to enable AI responses. Without a configured key or when the service is unavailable, the portfolio builder, content generator, and chatboard provide clearly labelled demo responses.

> **Matching scores are estimates.** They explain how profile details align with campaign requirements and are not guarantees of campaign success.

Technology

Flask and SQLite power the backend. The frontend uses plain HTML, CSS, and JavaScript as a single-page application with hash-based navigation.

Run locally

1. Install Python dependencies with `pip install -r requirements.txt`.
2. Start the server with `python app.py`.
3. Open `http://127.0.0.1:5000` in your browser.

Demo accounts

Creator: `demo.creator@creatorconnect.ai`
Brand: `demo.brand@creatorconnect.ai`
Password for both: `Demo@1234`

Additional demo creator profiles are seeded automatically when the app starts.

Security highlights

- Passwords are stored as Werkzeug password hashes.
- Database writes use parameterized SQL.
- Private routes check account roles; session cookies are HttpOnly and SameSite.
- AI routes use a simple per-IP rate limit.
